DETAILED DESCRIPTION

Detailed Description of the Invention

Field of the Invention

does not fall out from a lid, and a purchaser can choose an appearance again according to liking. which it can respond to the request that that it is also partial separates and a decoration part This invention relates to the cosmetics container which can raise the degree of freedom as

Description of the Prior Art

For example, and the pattern etc. was attached upwards using the imprint sheet, transparence and a translucent layer are piled [an alphabetic character a pattern, etc. are imprinted, or] up. and it is made to ornament at the body of a container, or a lid. [that sputtering etc. performs in order to raise the design nature to the body of these containers and lid which make the Generally, a cosmetics container is equipped with the body of a container which contains cosmetics, and the lid which opens this body of a container or is closed, and is constituted. And surface treatment] appearance of a cosmetics container, decoration is given by various approaches from the former.

Problem(s) to be Solved by the Invention]

and the purchaser had barred enabling it to choose the design-appearance of a cosmetics container of the design included in mind, but is considered that this had become the cause of container freely according to liking. For this reason, a purchaser cannot find the cosmetics mutually the request that it had to form in one so that a decoration part might become really partial separates and a decoration part falls out neither from the body of a container, nor a lid $-\!-\!$ which is full of a high-class feeling if it is in the conventional cosmetics container, that it is also By the way, it is the purpose of offering the cosmetics container as a product in the high quality refrainment from buying. cosmetics container was limited to the design which the producer selected on the other hand, indivisible to the body of a container, or a lid. Such a request meant that the appearance of a as — the above — even if it was in which decoration approach, separation impossible had

[Means for Solving the Problem]

it can respond to the request that that it is also partial separates and a decoration part does not invention can be originated in view of the above-mentioned conventional technical problem, and It aims at offering the cosmetics container which can raise the degree of freedom as which this

fall out, especially to a lid, and a purchaser can choose an appearance again according to liking,

in the above-mentioned lid toward the above-mentioned covering for exchange, It carries out this to the above-mentioned lid and is prepared in it exchangeable, and the through tube formed body of a container, and the lid which open and close this Covering for exchange which covers In the cosmetics container with which the cosmetics container concerning this invention has a having had the engagement object formed in this through tube, the piece of actuation which is

> fall out from a lid by this, and a purchaser can choose an appearance again according to liking. can respond to the request that that it is also partial separates and a decoration part does not piece of actuation and engages with the above-mentioned engagement object free [engaging tube, and is exposed from the above-mentioned lid, and the engaged body which is formed in this and releasing J as the description. It becomes possible to raise the degree of freedom as which it formed in the above-mentioned covering for exchange, penetrates the above-mentioned through

prevented, it also becomes possible to maintain the appearance of a cosmetics container good exchange in a lid using a hinge region is secured and enlargement of a cosmetics container is space to equip this with the through tube and engagement object for attaching covering for Since the piece of actuation is exposed to the rear face of a lid in a hinge region while a tooth exposed from the rear face of the opposite side with the front face of the above-mentioned lid is formed in the above-mentioned hinge region, said piece of actuation is characterized by being region connected with this body of a container free [rotation] is prepared and said through tube in it and to open and close said body of a container to the above-mentioned lid, while the hinge Moreover, in order for said covering for exchange to cover the front face to said lid, to prepare it

Embodiment of the Invention]

synthetic resin exchangeable. surface 6a of a lid 6 mainly consists of coverings 7 for exchange made of wrap board-like of the body 3 of a container concerned, and a lid 6 free $lue{}$ attachment and detachment $lue{}$, and container free [engaging and releasing]through hook 5, and maintains the closedown condition the synthetic resin of the shape of a board which engages with the other end of the body 3 of a a hinge 4 and opening and closing the body 3 of a container It is prepared in the lid 6 made of 2 was formed, and the body 3 of a container free [the rotation to the vertical direction] through end of the dished body 3 of the container made of synthetic resin with which the receipt crevice concerning this operation gestalt is shown in drawing 1 - drawing 4 , while connecting with the explained with reference to an accompanying drawing at a detail. As the cosmetics container 1 Below, 1 suitable operation gestalt of the cosmetics container concerning this invention is

attached in rear─face 6b of a lid 6. a rectangle, you may be the shape of a polygon, and a circle configuration. The mirror 8 is If it is in the example of illustration, although, as for the covering 7 for exchange, a flat-surface appearance profile is formed in the body 3 of these containers, a lid 6, and a list in the shape of

through the piece 12 of a hinge with a hinge pin. of a hinge, and a hinge block 13 is connected with the body 3 of a container free [rotation] shown) is inserted in the pin hole 14 formed ranging from these hinge blocks 13 to the piece 12 region made to hang from the other end of a lid 6 is put. It consists of that a hinge pin (not end of the body f 3 of a container in the opposite side in the hook f 5 The hinge block f 13 as a hinge between the pieces 12 of a hinge by which the pair protrusion was carried out from the other engages with the projection 10 for a hook free [engaging and releasing]. A hinge 4 moreover, the body 3 of a container, and a piece 11 of a hook which hangs from the end of a lid 6 and Hook 5 consists of projection 10 for a hook which protruded in the hollow 9 formed in the end of

7 for these exchange is really formed in separation impossible in one indivisible by the approach of general common knowledge to the covering 7 for exchange so that that it is also partial may separate and it may not drop out. design-appearance of a lid 6 freely according to liking. The decoration part given to the covering various kinds of various decoration was given is prepared so that a purchaser can choose the If the cosmetics container 1 and this operation gestalt have the covering 7 for exchange, what

appearance profile may be in agreement with the appearance profile of the body $oldsymbol{3}$ of a container While the covering 7 for these exchange is formed with the almost same dimension so that that

http://www4.ipdl.inpit.go.jp/cgi-bin/tran_web_cgi_ejje

JP,2004-113416,A [DETAILED DESCRIPTION]

the lid 6 with which this covering 7 for exchange is attached is formed with a dimension [a little] smaller than these, in order to secure installation cost, and on this lid 6, the covering 7 for exchange covers this and it repeats it. The quality of the material of the covering 7 for exchange may be not only the product made of synthetic resin but metal.

Between the covering 7 for exchange, and a lid 6, the 1st engagement section 15 and the 2nd engagement section 16 are formed by making these into an engagement means by which it is engaged free [engaging and releasing]. These engagement sections 15 and 16 are located in a hook [which are the both ends of a lid 6] 5, and hinge 4 side, respectively. Extended formation of the hook 5 circumference of a lid 6 and the hinge 4 circumference is carried out to the body 3 side of a container, and a tooth space larger than the general part of a lid 6 is obtained, the 1st engagement section 15 by the side of hook 5 — the [by the side of 1st engagement object 15a by the side of a lid 6, and the covering 7 for exchange] — it consists of engaged [1] body 15b, front?]

On the crevice 17 which hollowed the whole 1 side edge of the lid 6 with which the piece 11 of a hook is located in a completely different class toward the hinge 4 side, 1st engagement object 15a is made to project so that this crevice 17 may be covered partially, and is formed. the [moreover,] — from the suspension section 18 which made the whole 1 side edge of the covering 7 for exchange by the side of 1st engagement object 15a hang, engaged [1] body 15b makes the part corresponding to 1st engagement object 15a project toward the crevice 17 under the 1st engagement object 15a concerned, and is formed.

the [these 1st engagement object 15a and] — engaged [1] body 15b piles up the covering 7 for exchange from a lid 6 — the — when engaged [1] body 15b overcomes 1st engagement object 15a and enters in the crevice 17 under it, it is engaged free [engaging and releasing] mutually. the process overcome especially — the — the [1st engagement object 15a which gears mutually in the state of engagement while being formed in respect of / 19 / a taper, in order that the field where engaged / 1 / body 15b faces 1st engagement object 15a may make the riding **** smooth, and] — an angle is given and the corners 20 of engaged [1] body 15b are formed so that it may be hard to separate from mutual engagement.

the 2nd engagement section 16 by the side of a hinge 4 — the 1st engagement section 15 — the same — the [by the side of 2nd engagement object 16a by the side of a lid 6, and the covering 7 for exchange] — it consists of engaged [2] body 16b. The through tube 21 which penetrates a lid 6 in the vertical direction toward the covering 7 for exchange repeated on a lid 6 as shown in drawing 1 and drawing 2 is formed in a hinge block 13, and wall section 13a and outer wall section 13b are partially formed in a lid 6 thru/or a hinge block 13 of this through tube 21. Moreover, the mirror 8 of a hinge block 13 is faced, namely, with surface 6a of a lid 6, as a through tube 21 is surrounded in the side face facing rear—face 6b of the opposite side, the hollow section 22 is formed in it. And wall section 13a is made to project into a through tube 21 from this, and 2nd engagement object 16a is formed.

On the other hand, while the suspension section 24 inserted in the hollow 23 which that whole hinge side edge edge was made to hang toward a lid 6 side, and was formed in the whole hinge side edge edge of a lid 6 is formed, inside this suspension section 24, the piece 25 of actuation which penetrates a through tube 21, becomes depressed from a lid 6, and is exposed in the section 22 is formed at the covering 7 for exchange. If it is in this operation gestalt, this piece 25 of actuation has elasticity, and from the covering 7 for exchange, by considerable die length, it hangs and it is formed so that flexible deformation may be possible, the [and / which this piece 25 of actuation is made to project so that 2nd engagement object 16a may be faced, and is engaged free / 2nd engagement object 16a and engaging and releasing concerned] — engaged [2] body 16b is formed.

the [these 2nd engagement object 16a and] — if engaged [2] body 16b also piles up the

covering 7 for exchange from a lid 6 — the — engaged [2] body 16b overcomes 2nd engagement object 16a, and is engaged free [engaging and releasing] mutually, the process overcome if it is in this 2nd engagement section 16 — the [2nd engagement object 16a and] — the field where engaged [2] body 16b faces mutually the [2nd engagement object 16a which gears mutually in the state of engagement while being formed in respect of / 26 and 27 / a taper, in order to make the riding **** smooth, and] — an angle is given and the corners 28 of engaged [2] body 16b are formed so that it may be hard to separate from mutual engagement [0018]

If an operation of the cosmetics container 1 concerning this operation gestalt is explained, as shown also in <u>drawing 3</u> and <u>drawing 4</u> in case the purchaser who purchased the cosmetics container 1 exchanges for the new covering 7 for exchange of other designs the covering 7 for exchange with which the lid 6 is equipped A lid 6 is rotated in the vertical direction, the body 3 of a container is opened, and press actuation of the piece 25 of actuation exposed to the hollow section 22 of the hinge block 13 which appeared in the rear face of a lid is carried out toward the back of the hollow section 22.

[0019

if press actuation of the piece 25 of actuation is carried out — flexible deformation of the piece 25 of actuation concerned — following — the — since engaged [2] body 16b secedes from 2nd engagement object 16a, it is made to pull apart the covering 7 for exchange to a lid 6 after that thus — if the 2nd engagement section 16 is made to break away and the covering 7 for exchange is made to separate from a lid 6 — the [1st engagement object 15a of the 1st engagement section 15, and] — engagement to engaged [1] body 15b can be made to be able to break away, and the covering 7 for exchange can be removed from a lid 6.

subsequently, in case a lid 6 is equipped with the new covering 7 for exchange If the covering 7 for exchange is pushed against the 2nd engagement section 16 side toward a lid 6 in the condition of having made the 1st engagement section 15 engaged, while the piece 25 of actuation will enter in a through tube 21 the flexible deformation — the — it engages with 2nd engagement object 16a, and thereby, engaged [2] body 16b can lay the new covering 7 for exchange on top of a lid 6, and can attach it.

If it is in the cosmetics container 1 concerning this operation gestalt as explained above The covering 7 for exchange which covers this to a lid 6 and is prepared in it exchangeable, and the through tube 21 formed in the lid 6 toward the covering 7 for exchange, 2nd engagement object 16a formed in the through tube 21, and the piece 25 of actuation which is formed in the covering 7 for exchange, penetrates a through tube 21, and is exposed from a lid 6, the [which is formed in the piece 25 of actuation and engages with 2nd engagement object 16a free / engaging and releasing], since it had engaged [2] body 16b the appearance of the cosmetics container 1 is limited to the design which the producer selected — there is nothing — as the cosmetics container 1—a purchaser — liking — responding — an appearance — a degree of freedom — it shall choose highly and, thereby, attractiveness to consumers shall be raised [0022]

Moreover, as covering 7 for exchange, like the conventional lid etc., that it is also partial separates, and a decoration part does not fall out from the covering 7 for exchange, and the cosmetics container 1 as a product can be offered in the high quality which is full of a high-class feeling without the former and inferiority that what is necessary is just to form the decoration part of each other in separation impossible in one really indivisible therefore. Moreover, the 1st engagement section 15 and the 2nd engagement section 16 which are engaged free [engaging and releasing] in these are prepared between the covering 7 for exchange, and a lid 6, and covering 7 for exchange can be easily exchanged by engaging—and-releasing actuation of these engagement sections 15 and 16.

If it is in this operation gestalt, the covering 7 for exchange covers the surface 6a to a lid 6, and is prepared in it. Furthermore, to a lid 6 In order to open and close the body 3 of a container,

http://www4.ipdl.inpit.go.jp/cgi~bin/tran_web_cgi_ejje

.

engagement section 16 rationally, without enlarging the dimension of the cosmetics container 1 engagement object 16a using a hinge block 13 is secured. While being able to have the 2nd exposed from rear-face 6b of the opposite side with surface 6a of a lid 6 The tooth space for while the hinge block 13 connected with the body 3 of a container concerned free [rotation] is Since the piece 25 of actuation is exposed to rear–face 6b of a lid 6 in a hinge block 13, when having closed the lid 6, of course, the appearance of the cosmetics container 1 can be having the through tube 21 for attaching the covering 7 for exchange in a lid 6 and 2nd formed and a through tube 21 is formed in a hinge block 13 Since the piece 25 of actuation is maintained good also in the condition of having opened.

which 2nd engaged portion 16b is made to engage and release, it can raise the operability of engaging-and-releasing actuation of the 2nd engagement section 16. Moreover, by having spring nature, since flexible deformation is free for the piece 25 of actuation

explained if it was in this operation gestalt, of course, you may apply to the various containers of the type which detaches and attaches a lid-6 according to screw structure or path fitting structure not only to this but to the body 3 of a container. Although the cosmetics container 1 equipped with the hinge 4 or the hook 5 was illustrated and

[Effect of the Invention]

choose an appearance again according to liking can be raised. decoration part falls out neither from the body of a container nor a lid, and a purchaser can Above, in short, if it is in the cosmetics container concerning this invention, the degree of freedom as which it can respond to the request that that it is also partial separates and a
